- Poured Walls
- Decorative Concrete
- Concrete Restoration Services

Concrete

for Energy Efficient Interiors and Exteriors

Stronger • Drier • Quicker • Solid • Efficient • Quality • Affordable • Durable

CONCRETE is the preferred building material in construction, especially for builders with an eye on energy efficiency and the use of sustainable materials. Concrete is completely recyclable.

The poured wall system consists of reinforced concrete wall, sprayed applied waterproof membrane, premium drain tile and a 2" extruded polystyrene with protective coating. This process not only ensures energy efficiency, but it also provides a defense against mold that is commonly a problem with traditional foundations. An additional option is to have two inches of polystyrene installed under concrete slabs. This, combined with a "geo-thermal" heat system, will provide energy efficiency as well as lower heating and cooling costs throughout the year.

Many different options are available today for exterior concrete, from exposed aggregate to stamped and colored concrete. With many different patterns and color options, the final design is limitless.

For existing interior concrete, a chemical stain can be applied along with decorative cuts to give that tiresome concrete a new life.

Restoration services on existing concrete are also available. Using a high pressure sprayer, years of dirt and mildew can be removed from your concrete. Once clean, a high quality sealer will be applied giving your concrete a fresh look and discouraging any future decay.
